

To Stop a Thief: iFortress

Posted: September 2, 2008

Developed to Protect Data Centers, iFortress Secures Art, Jewelry, Antiques and More

HOLBROOK, NY – Future Tech Enterprise has partnered with iFortress to offer the East coast's first data center protection solution that also offers the additional benefit of protecting high-end retail valuables.

iFortress is a modular structure designed to protect important assets from nearly every imaginable human or environmental threat, including disastrous events like floods, hurricanes and fires, disgruntled employee sabotage and theft, or insidious catastrophes caused by leaking toilets, dust, humidity, and salt air. The hermetically sealed walls provide a constant inside temperature, regardless of the temperature changes on the outside environment. Originally designed to protect IT assets, iFortress has become the ideal solution for protecting everything, including artwork, historical documents, and medical records.

Soon to be certified as LEEDS green technology, iFortress is made of materials that are recyclable, scalable, movable, and represent the most energy-efficient data center model in the world. It can be built at, above or below grade and can stand two stories high; it can also stand alone or be built inside an existing structure.

Future Tech's CEO Bob Venero commented, "We are pleased to partner with iFortress in bringing this dynamic solution to the market. The addition of iFortress in our company has proved to be a big step toward a greener workplace here at Future Tech, and is helping organizations protect valuable data and inventory."

Future Tech's data center is currently enclosed by the iFortress and since the installation, the CFO reports a 20% reduction in energy costs, emphasizing the environmental benefits provided by the iFortress.
