

Engineering Services Support

Future Tech Helps Leading Air Transport Communications Fly Above Competition

Company X is a world leader in air transport communications and information technology, serving more than 90% of domestic and global airports. Future Tech has been providing this customer with logistics, procurement, installation, implementation, and advanced engineering services since 2011.

Future Tech's engineering team, working in collaboration with the customer's engineers and project managers, created standardized storage SANs that are ideally suited for each of Company X's three unique customer segments. This approach produced a predictable and repeatable process for Company X to implement technologies at customer locations on a global scale.

Along with improved customer satisfaction, Company X leaders have reported that this hybrid cloud approach has delivered major cost savings for SITA and its customers, reducing administrative burdens, a more than 50% reduction in procurement times, and shorter project lifecycles.
